**Activity Report September 2018-September 2019**

## Introduction

The Center of Excellence for Functional Surfaces and interfaces for Nano diagnostics (EFSUN) was established in September 2016. The Center aims at the discovery of efficient tools for an early, efficient accurate, cheap and on-site diagnosis of important health problems using nanotechnology tools. Highly qualified local researchers in various fields, including medicine, molecular biology, genetics, pathology, chemistry, physics, engineering, nanotechnology and electronics were brought together in the center in order to generate original, innovative and patentable knowledge and produce high impact research. Moreover, interdisciplinary nature of the center facilitates coordinated interactions between members from different fields to reach a common goal of generation of high-tech nano-based diagnostic devices. The advisory board consists of outstanding and experienced researchers from the best institutes and universities in the US and in Europe. EFSUN is now a center of attraction in the fields of nanotechnology and medical diagnostics in Turkey as well as in the region, and it always welcomes motivated researchers who would like to join forces to reach this goal.

The Center was founded by 5 scientists who were soon joined by 36 scientists, who are world-class experts in their respective fields. Contributing members are recipients of various prestigious national and international awards. Collaborations with the industry are ongoing. More than 33 Ph.D. students and 34 M.S. students as well as more than 10 Post Doctoral Research Associates are benefitting from the stimulating and collaborative environment of the Center.

Within a short time, the Center became a 'Research Powerhouse' at Sabancı University with exhaustive and collaborative efforts of the members. The research efforts and collaborations in the Center led to more than 64 journal publications in top journals (such as International Journal of Heat and Mass Transfer, Chemical Engineering Journal, Nature Scientific Reports, Nanoscale, etc.) within 12 months, 9 joint patents applications were made, and 3 joint patent grants were obtained within 12 months. Significant large scale grants were also obtained from both national and international resources. The ongoing project budget is now more than 4,500,000 Euro. Our Center is now seeking for TUBITAK (The Scientific and Technological Research Council of Turkey) 1004 Center of excellence Funding in collaborations with our outstanding centers in Turkey such as SUNUM (Sabancı University Nanotechnology and Applications Center). The members are self sustaining the Center and providing high impact outputs within the framework of the Center without any substantial support from Sabancı University.

We are happy to provide our contributions for organizing exciting events such as 'The Functional Surfaces and Interfaces Workshop' held at Sabancı University SUNUM building and 'Applied Nanotechnology Winter School' for High School students in collaboration with SUNUM.

This activity report is intended to provide a collection of the outputs of the center.

## Research Activities in EFSUN

### EFSUN - Center of Excellence on Nano Diagnostics (<http://efsun.sabanciuniv.edu>) Prototype Project Scheme

**The Prototype Project Scheme:** Collaborative efforts of EFSUN Researchers who are experts in their respective fields, will allow creation of a cell phone-assisted platform for quick, cheap and accurate on-site detection and diagnosis of diseases. Clinical materials (tumors, various tissues, blood, urine, saliva etc) that are collected by clinical medical doctors, are analyzed using molecular tools (omics approaches, molecular biology, genetics, cell biology, biochemistry) and novel disease markers are discovered. Experts of bioinformatics and computational biology analyze the results of high-throughput omics approaches. Currently at least 5 protein and 5 RNA new and patentable markers of cancer were already discovered by EFSUN researchers, others are in the pipeline. Innovative microfluidic biochips are used in order to enrich, purify or separate cells and biomolecules in clinical materials. Using home-made antibodies, specially designed and functionalized nanoparticles and innovative physico-chemical detection approaches, EFSUN researchers are able to detect femto to subfemtomolar concentrations of disease markers. Signal detection is achieved using a home-made and patentable detection devices that process information in a cell phone and Cloud-assisted manner, and operating with a custom-designed application. Therefore, all components and parts of EFSUN Cell Phone-Assisted Diagnosis Systems are a result of cutting-edge science and technology.

*EFSUN Center of Excellence: Fascination of science and technology, excellence in surfaces , interfaces and diagnostics.*
